Dear Mr. Cooper:

Just a quick note to let you know how satisfied we are with your program.

We purchased the StormNET program two years ago and found it made the stormwater analysis of our site development projects very simple and quick. What used to be a tedious process became efficient. We find its features especially convenient, surface slopes, area runoff characteristic, pipe sizes, drainage structure types can all be modified with simple pop-up menus.

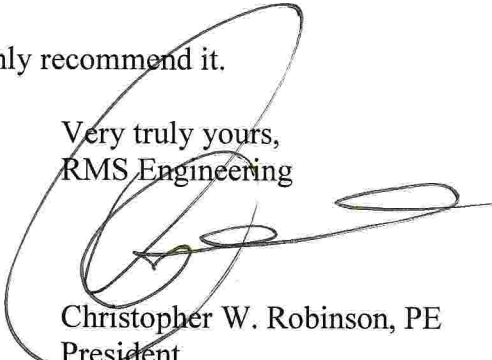

Once the base model is set up, the user can analyze the site for 10-year, 25-year and 100 year storms in minutes. The integration with CAD files is one of the top features.

The output file is easy to decipher. The data is well organized all of the input parameters can be given custom names, making the model simple to understand, especially for those who need to review the models. The profile view showing the drainage system is a very useful output feature. The colored profile provides a clear picture of the system and makes it easy to spot if there were any input errors concerning slopes, inverts, etc.

Combining the programs great features with a fantastic help-support system makes this a very worth while program to purchase. Thank you again for providing such a great support team.

This is a great program and I would highly recommend it.

Very truly yours,
RMS Engineering
